

# PUTTING IT TOGETHER

A simplified guide to building pages from scratch

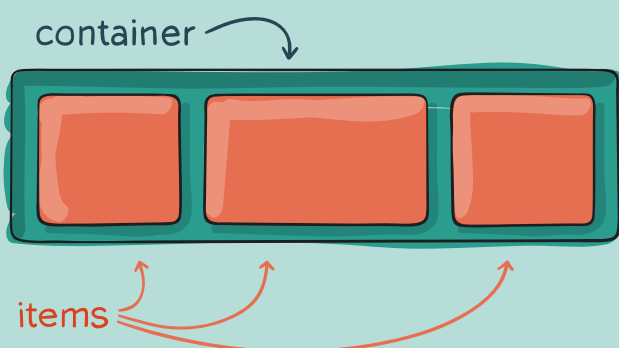

1

Use **semantic elements** to communicate **meaning** of major parts of the site.

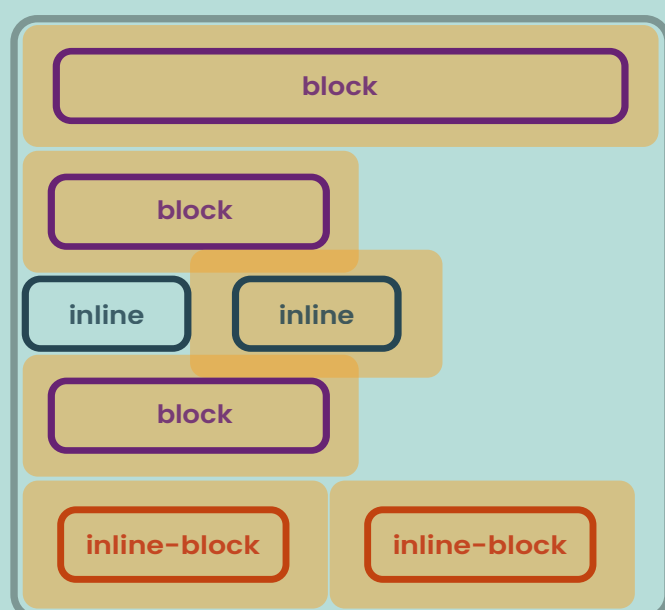

2

Identify **parent-child relationships** necessary to create the desired layout.

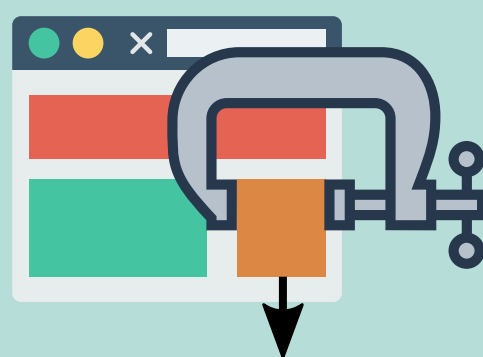

3

Modify **display properties** to control **flow behaviour** and **vertical spacing** inside containers.

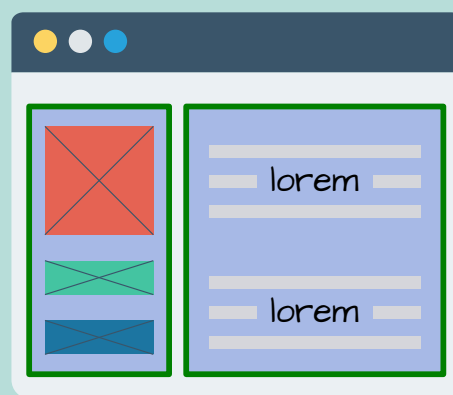

4

**You** control the **width**, let the **content** drive the **height**.

5

Use **filler content** to create spacing. **Temporary borders or backgrounds** help visualize elements.

6

Decide how **margins** and **padding**s should **change** relative to **font-size** or container **width**.
